

Q.6) Write a program to remove all occurrence of a substring from a string.

```
def Substring(input_string, substring):
```

```
    result = input_string.replace(substring, "")  
    return result
```

```
user_input = input("Enter the main string: ")  
substring_input = input("Enter the substring to remove: ")
```

```
new_string = Substring(user_input, substring_input)
```

```
print("Modified string:", new_string)
```
